Differential expression, PD vs GM − all T cells

Pseudobulk voomLmFit, donor−blocked (. = 0.71), sample−weighted

n = 21 samples (13 GM / 8 PD); 10796 genes after filtering. TMM−normalised.
Dashed lines: |log2FC| = 1. Colour = BH−adjusted significance; y−axis = unadjusted p.
Immunoglobulin genes excluded (ambient, donor−driven). Yellow outlined: genes of interest, labelled regardless of significance.
NOTE: whole−compartment pseudobulk is confounded by cluster composition; see per−cluster results.
